

Scenario 16

A user has written a custom topology in a file named `mydc.py`. The topology class inside is named `FatTree`.

Question: What is the full Mininet command to run this specific custom topology from the terminal?

Answer:

To run the custom topology defined in `mydc.py`, the user would execute the following command in the Linux terminal:

```
sudo mn --custom mydc.py --topo FatTree
```

Explanation:

- `sudo mn` : Launches Mininet with superuser privileges (required to set up network namespaces and virtual interfaces).
- `--custom mydc.py` : Directs Mininet to import and parse the custom Python file containing the topology definition.
- `--topo FatTree` : Specifies the exact name of the custom topology class defined inside `mydc.py` to construct.
