

Scenario 15

A student is writing a custom Python script to create a data center topology. They have added two switches, s1 and s2, to their topology object (self).

Question: What line of Python code using the Mininet API would they write to create a connection between these two switches?

Answer:

To connect the two switches inside a custom Mininet topology class inheriting from `Topo`, the student would write:

```
self.addLink(s1, s2)
```

Explanation:

Within a custom Mininet `Topo` class, `self.addLink()` is the standard API method used to create a bidirectional virtual link between two nodes (switches or hosts) passed as parameters.
