

Scenario 12

You are running a Mininet simulation with a remote controller. You believe the controller is not correctly installing flow rules on switch s3.

Question: What command would you run in the main Linux terminal (not the Mininet CLI) to inspect the flow table of switch s3?

Answer:

To inspect the flow table of switch `s3` from the main Linux terminal, you would run the following command:

```
sudo ovs-ofctl dump-flows s3
```

Explanation:

In Mininet, switches are implemented using Open vSwitch (OVS). The `ovs-ofctl` utility is used to query and control OpenFlow switches. Running `dump-flows s3` queries switch `s3` directly via OpenFlow protocol commands and displays all currently active flow entries in its flow table.
