

Scenario 13

A student needs to run a performance test between two hosts, h1 and h2, in Mininet. They need to start a server on h2 and a client on h1 to measure bandwidth.

Question: What Mininet CLI command would they use to open separate terminal windows for h1 and h2 to run these commands?

Answer:

To open separate terminal windows for hosts h1 and h2 from the Mininet CLI, the student would run the following command:

```
xterm h1 h2
```

Explanation:

Executing `xterm h1 h2` launches two distinct X11 terminal windows, one for host `h1` and one for host `h2`. This allows the student to execute host-specific commands simultaneously in separate windows:

- In the **h2** terminal window, start the iperf server: `iperf -s`
- In the **h1** terminal window, start the iperf client targeting h2: `iperf -c <h2_IP>`
